This sequence represents a somatostatin analogue of the invention. The invention relates to a backbone cyclised somatostatin analogue that has cone building unit contraining a nitrogen atom of the peptide backbone connected to a bridging group comprising an amide, thioether, thioester or disulphide. At least one building unit is connected from a second contraining the connected from a second building unit, side chain of or N-terminal amino acid residue. A composition containing the analogue may be used for preventing disorders out has cancers, autoinmune diseases, endocrine disorders, diabeticassociated complications, gastrointestinal disorders, inflammatory diseases, pancreatitis, atherosclerosis, restenosis and post-suggical pain. It may also be used for diagnosing cancer. The backbone cyclic analogues can be used for the treatment patients with hormone-secreting analogues can be used for the treatment patients with hormone-secreting and hormone-dependent tumours. They reduce diarrhoea through the inhibition of vasoactive intestinal peptide (VIP) secretion and by direct effect on intestinal secretion. Somatostatin analogues selective to type canders mellitus. They are useful for the prevention of atherosclerosis and restenosis. The analogues are metabolically stable, selective in their in-vivo activities and safe Cyclized somatostatin analogs for inhibiting growth hormone secretion from anterior pituitary and as antiproliferative agents for the treatment of tumors. Example 11; Page 61; 82pp; English.

(I) has antiarteriosclerotic, immunosuppressive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amino acid residue. (I) has antiarteriosclerotic, immunosuppressive, cytostatic, antidiabetic, antiinflammatory and analgesic activities, and can be used as a somatostatin receptor ligand. (I) are useful in the treatment of atherosclerosis, autoimmune diseases, cancers, diabeticassociated complications, endocrine disorders, inflammation, gastrointestinal disorders, pancreatitis, post-surgical pain, and

The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A set of peptide ligands consisting of specific complementary peptides proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, there is spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
restenosis. (I) can also be used in the diagnosis of cancer, by imaging the existence of metastases, it being labeled with a detectable probe. The present sequence represents a backbone cyclised somatostatin analogue from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

AAU02225-AAU02384 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HLA A0201, HLA A0205, HLA A1, HLA A24, HLA B7, HLA B9, HLA B2702, and HLA B4603. Thour antigen derived gene-16 protein, TADG-16 (AAU0223), is a novel human extracellular serine protease. TADG-16 is expressed in normal ovaries and testes and in certain ovarian carcinomas. TADG-16 contains the conserved catalytic triad, His-Asp-Ser, and a signal secretion sequence characteristic of the serine protease family. An antisense oligonucleotide having a complementary sequence to the TADG-16 nucleic acid is useful for treating various cancers, including ovarian, breast, lung, colon and proteate. The TADG-16 nucleic acid is useful for treating are useful for the diagnosis of cancer. TADG-16 protein or its fragments are useful for vaccinating an individual against TADG-16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAU02225-AAU02284 represent TADG-16 peptides which are tested for their binding affinity to the 8 haplotypes HLA A0201, HLA A0205, HLA A1, HLA A24, HLA B7, HLA B7, HLA B7, TA B2702, and HLA B4403.                                                                                                                                                                                                                                                                                                                                                                                                           Isolated proteinaceous substance - comprising at least one virus epitope derived from an attachment protein of a paramyxovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neuraminidase (HN) protein of the paramyxoviridae. The specification describes 3-D models identifying a proteinaceous substance comprising at least one virus epitope derived from the attachment protein, which corresponds to an antigenic site present on one of the loops of HN. The antigenic sites can be used to produce vaccines, to detect the viruses, and to select the immunodominant epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW97452-571 represent antigenic sites derived from the haemagglutinin-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptides or nucleic acids encoding an HIA binding peptide. The composition further comprises an HTL epitope. It also comprises a spacer molecule, a carrier, an MHC targeting sequence or a lipid. The peptides are incorporated as part of a liposome. The peptide is from an antigen selected from prostate specific antigen (PSA), prostate specific membrane antigen (PSA), prostate specific membrane antigen (PSA), prostate specific membrane antigen (PSA), hepatitis C virus (HCV) antigen, malignat melanoma antigen (MSA) antigen, hepatitis C virus, human immunodeficiency type-1 (HVV-1), human immunodeficiency type-2 (HIV-2), Papilloma virus, Lassa virus, Mycobacterium tuberculosis (MT), p53, murine p53 (MPS), CEA, HERZ/neu, and tyrosine kinase related protein (TKP). The composition is useful for preventing or treating viral infections or cancer, such as prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, CMV or chondyloma
complementary sequence to the TADG-16 nucleic acid is useful for treating various cancers, including ovarian, breast, lung, colon and prostate. The TADG-16 nucleic acid, TADG-16 protein and antibodies specific to TADG-16 are useful for the diagnosis of cancer. TADG-16 protein or its fragments are useful for vaccinating an individual against TADG-16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition of peptides and nucleic acids capable of binding Major Histocompatibility Complex molecules, useful for diagnosing, preventing or treating viral infections or cancer, such as prostate cancer,

The present sequence represents a peptide capable of binding Rhesus D antibodies (I). Also described in the present invention are: (1) a uncleic acid (II) encoding (II); (2) a vector (III) comprising one or more (III) operably linked to an expression control system; (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) comprising immunologic properties of Rhesus D protein recognising an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage comprising subjecting an antibody/antibody fragment recognising an epitope of Rhesus D protein; and (6) peptide sequences which are minotopes which differ in their amino acid sequence from the amino acid sequences of Rhesus D protein; and (6) peptides (V) with immunological properties of Rhesus D protein epitopes obtained by (M1). (1) is used to cannifecture an agent for the diagnosis, therapy or prophylaxis of the chiseases associated with Rhesus D antigen, e.g. haemolytic disease of the manufacture of an affinity reagent for anti-Rhesus D antibodies purified or removed from body fluids or immunoglobulin preparations. Using (I) as an immunogen to raise anti-Rhesus D antibodies avoids using immunisation of with forcest perturbors the properties of the properties thereby avoiding the risk of transmission of
                                                                                                                                     ö
acuminatum. The composition is also be used for diagnosing such diseases. This sequence represents a peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of the

human immunodeficiency virus-1 (HIV-1) group comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequences (ABL2347 to ABR25397). (1) has virucide activity and can be used in vaccines. (1) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccines compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of escape mutants. Furthermore, immunospenses to andigens, which the use of group-based vaccines An additional advantage of an group-based vaccine approach is the ability to combine selected groups. (CTL and HTL), and further, to modify the composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the exemplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                               RESULT 14
                                                                                                                                                                                                                        ABP22594
                                                                           ò
                                                                                                                      셤
                                                                                                                                                                                                                                                                        The present sequence represents a peptide capable of binding Rhesus D antibodies (1). Also described in the present invention are: (1) a nucleic acid (II) encoding (I); (2) a vector (III) comprising one or more (II) operably linked to an expression control system; (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) comprising while this mannologic properties of Rhesus D protein epitopes of Comprising an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage display library, and identifying immunogenic peptide sequences which are minotopes which differ in their amino acid sequences of Rhesus D protein, and (6) peptides (V) with immunological properties of Rhesus D protein epitopes obtained by (M1). (I) is used to manufacture an agent for the diagnosis, therapy or prophylaxis of manufacture of an affinity reagent for anti-Rhesus D antibodies purified or removed from body fluids or immunoglobulin preparations. Using (I) as an immunogen to raise anti-Rhesus D antibodies avoide using immunisation of viral diseases like ADS and hepatitis B
                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel peptides capable of binding Rhesus D antibodies are used to manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. hemolytic disease of the newborn (HDN)
                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rhesus D antibody binding peptide; Rhesus D; RhD; identification; anti-Rhesus D antibody; immunogen; epitope; diagnosis; therapy; prophylaxis; haemolytic disease of the newborn; HDN; ITP; idiopathic thrombocytopaenic purpura; immunoglobulin.

The present invention describes a composition (I) comprising a prepared human immunodeficiency virus-1 (HIV-1) group comprising an amino acid sequence selected from 51 defined amino acid sequences (ABL25347 to ABP25397). (I) has virucide activity and can be used in vaccines. (I) may be used for immunising subjects against HIV-1 infections. The use of group-based vaccines has several advantages over traditional vaccines, particularly when compared to the use of whole antigens in vaccine compositions. There is evidence that the immune response to whole antigens is directed largely toward variable regions of the antigen, allowing for immune escape due to mutations. The groups for inclusion in an group-based vaccine may be selected from conserved regions of viral or tumour-associated antigens, which therefore reduces the likelihood of the antigens. Purhermore, immunosuppressive groups that may be present in whole antigens can be avoided with the use of group-based vaccines. An additional advantage of an group-based vaccine approach is the ability to composition of the groups, achieving, for example, enhanced immunogenicity. Accordingly, the immune response can be modulated, as appropriate, for the target disease. Similar engineering of the response is not possible with traditional approaches. ABP11501 to ABP25412 represent peptide sequences used in the examplification of the present invention. (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIV; HIV-1; human immunodeficiency virus; env; pol; gag; nef; vpr; vpu; vif; tat; cytotoxic T lymphocyte; CTL; immune response; epitope; antigen; vaccine; HIV infection; immunisation; virucide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine compositions comprising human immunodeficiency virus-1 (HIV-1) peptide groups, useful for vaccinating against HIV-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chesnut R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Southwood S, Livingston BD, Kubo RT, Grey HM;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                      (without alignments)

Patent No. 5942491

GENERAL INFORMATION:
APPLICANT: Root-Bernstein, Robert S.

TITLE OF INVENTION: Methods and Compositions for Treating
TITLE OF INVENTION: Arthritis
NUMBER OF SEQUENCES: 19

CORRESPONDENCE ADDRESS: 19

ADDRESSEE: Dressler, Goldsmith, Milnamow & Katz, Ltd.

STREET: 180 N. Stetson
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 30; DB 4; Length 9; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                              (without alignments)

T-cell receptor beta chain V-D-J region (121-2CL) - mouse (fragment)
C.Species: Mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Accession: PT0634
R.Feeney, A.J.
J. Exp. Med. 174, 115-124, 1991
A.Riference number: PT0509; MUID:91277601; PMID:1711558
A.Accession: PT0634
A.Accession: PT0634
A.Accession: PT0634
A.Molecule type: mRNA
A.Residues: 1-9 FFEE
                                                                                                                                                                                                                                                                                                                                             Anjaryon and the manusching enzyme inhibitor - yellowfin tuna C.Species: Thunnus albacares (yellowfin tuna)
C.Species: Thunnus albacares (yellowfin tuna)
C.Species: Thunnus albacares (yellowfin tuna)
C.Accession: A31570

(LUDW-) LUDWIG INST CANCER RES. (LICN ) LICENTIA LTD.

Alitalo K, Koivunen E, Kubo H;

WPI; 2002-691521/74.

New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 13; Page 80; 149pp; English.

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung,

spleen, kidney, lymph node, small intestine, blood cells

(1) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and texting disorders mediated by the activity of the cell surface receptor VBGFR-3 such as cancer, e.g. brain, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotensive; antiidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                    ovary,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                        pancreas, colon, stonach, breast, endometrium, prostate, testicle, ovary skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; hepatotropic; antiinflammatory; hypotenaive; antidiabetic; vulnerary; cell surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the present invention
                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The protein sequences shown in ADC85549-ADC87617 represent GPCR's of the invention.
         pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a VEGFR-3 binding peptide, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polynucleotide, useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor.
                                                                                                                                                                                                                                                                                                                          GPCR; guanosine triphosphate-binding protein coupled receptor;

The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Furthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the cancer-related Tiel-binder peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selecting target and target binder pairs for preparing a composition for treating cancer by mixing in a reaction vessel phage expressing biological targets and phage expressing target binders.

                                                                                                                                                                                                                              The invention relates to novel isolated polypeptides comprising a sequence that binds an immunoglobulin Fc region. The polypeptides are useful as binding molecules for detecting, isolating or purifying immunoglobulin Fc-region polypeptides present in a solution, e.g. whole blood, plasma or transgenic milk. The Fc-region binding polypeptides are also useful for regulating or preventing an antibody response, or for increasing the half-life and over all stability of a therapeutic or diagnostic compound that is administered to or enters the circulatory system of an individual. This sequence represents an Fc region binding

                                                                                                                                                                                                          The invention relates to a method of evaluating sample by providing a soluble serum protein (I), one or more compounds physically associated with (I), and a (II-binding agent that comprises a peptide that specifically binds to (I) allowing the (I)-binding agent to bind to to form a complex including one or more compounds physically associated sample, and evaluating one or more of the physically associated compounds. The sample complex from one or more components of the sample comprises blood or serum, or is obtained from a biopsy. The sample may also be obtained from a tumour or a region within modulate interaction of serum protein-binding compound and serum protein and for identifying binding ligands for serum protein. The present sequence represents a serum albumin-binding peptide identified using the
Evaluating sample comprising soluble serum protein by forming complex comprising serum protein and physically associated compounds using peptide ligand that specifically binds with proteins, which is separated and evaluated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       respiratory; cytostatic; antiarthritic; antiinflammatory; gastrointestinal; antibacterial; immunosuppressive; antidiabetic; antirheumatic; gene therapy; molecular weight marker; chromosome marker; chromosome tag; genetic fingerprinting; nutritional supplement; cancer; inflammatory condition; arthritis; inflammatory bowel disease; crohn's disease; sepsis; rheumatord atthritis; diabetes mellitus type 1; graft versus host disease; human; expressed sequence tag; EST.

comprising a nuclectioe sequence selected from SEQ ID NO:1-244, or (b) comprising a nuclectide sequence selected from SEQ ID NO:1-244, or (b) comprising a nuclectide sequence selected from SEQ ID NO:1-244, or (b) comprising a nuclectide sequence selected from SEQ ID NO:1-244, or high encodes a polypeptide with biological activity, where the polynuclectide hybridiaes to (I) under stringent hybridiaeticor.

CC or has greater than 99% sequence identity with (I). (I) has respiratory, antibacterial, immunosuppressive, antidiabetic and antirheumatic cryostatics, and can be used in gene therapy. (I) can be used for generating polynucleotides encoding chieric or fusion proteins and heterologous protein sequences. The polynucleotides can be used for carporating polynucleotides encoding chieric or sexpess recombinant protein for analysis, characterisation or therapeutic use; as markers for tagsues in which the corresponding protein is protein or sexpess recombinant protein for analysis, characterisation or therapeutic use; as markers for tagsues in which the corresponding protein is checked by sequences; as molecular weight markers on gene; as markers for genetic disorders; as source of information to derive PCR configurations, to compare with endogenous DNA sequences in the process of identify protein or expression patterns; to raise antiport including for examination of expression patterns; to raise antiport including for examination of expression patterns; and as antigen protein antibodies using DNA immunisation techniques; and as an antigen protein antibodies or elicit another immune response. The polynucleotides and polypeptides can also be used as nutritional sources or supplements, e.g. as a protein or animo acid supplement, as a currer of supplements, e.g. as a protein or endogeneration of treater closure of non-healing wounds, for the generation and treatment of lung or liver fibrossis, compositions are useful for promotices can also be used to treat cronditions real nutries and polypeptides can also be used as 
cancer, lung or liver fibrosis, arthritis, inflammatory bowel disease, Crohn's disease, rheumatoid arthritis, diabetes mellitus type 1 or graft
                                                                                                                                                            present invention describes an isolated polynucleotide (I): (a)
                                                                                                     Example 2; SEQ ID NO 743; 591pp; English.
                                                         versus host disease.

The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site I of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are antagonists of the insulin-like growth factor-I (IGF-1) receptor are useful for treating insulin-like growth factor (IGF-1) receptor are useful for treating insulin-like growth factor (IGF-) sensitive tumours (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabetic neuropathy. The peptides are also useful in exceptor agonists and research reagents. Adusso34-Adus09557 represent IR and/or IGF-1 receptor-binding peptides and related amino acid sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cancer; treatment; anticancer; cytostatic; gene therapy; sequence tag.
                                                                                                                                                                                                                                                           Modulating insulin activity in mammalian cells, for treating e.g. diabetes and tumors, comprises using peptides that bind to insulin or insulin-like growth factor receptors.

This invention describes novel CDNA sequences (A) highly expressed in normal uterine tissue which can have anticancer and cytostatic activity and can be used for gene therapy. (A) are used (1) for recombinant expression of polyapptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine cancer; (ii) directly for treating this form of cancer including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTB (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTB from different libraries may represent different parts of the same cunknown gene, discorting the estimated frequency of cocurrence in a particular tissue. ANYS9838-YS9832 represent protein fragments encoded by the human uterine tissue derived CDNA fragments represented in AAZ41325-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                          New nucleic acid sequences expressed in normal uterine tissues, and derived polypeptides, for treatment of uterine cancer and identification of therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense; prokaryotic essential gene; cell proliferation; drug design.

c. The invention relates to an isolated nucleic acid compitibing any one of the 6213 antisense sequences given in the specification where expression to the 6213 antisense sequences given in the specification where expression to the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated to polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the attisted polypeptide or the activity of a gene in an operon required for proliferation or that activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation or that the hast callular proliferation of the gene product or that the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibicing collectation of an organism acts; (9) manufacturing an antibicing or the biological compound's activity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of product is overexpressed, or underexpressed; (10) profiling a compound that inhibits the compound that inhibits the compound activity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of confidentifying the target of a compound that inhibits the confidentifying proteins or screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, cell antifying prokaryotic essential genes. Note: The sequence is encoded by one of the target promit discovery programming general sequence is encoded by one of the target promit discovery programming general sequence is encoded to the target promit discovery programming and pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ij

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-AUG-2003
  The present invention describes a method for detecting a stress that alters a functional interaction of a low density lipoprotein (LDL) receptor binding protein (1) with an LDL receptor interaction domain (II). The method involves introducing a predetermined stress into a system which provides a stress-biased physical interaction of (I) with contact of the stress, the system provides an unbiased interaction of (I) and (II), and detecting the stress-biased interaction of (I) and (II), where in the absence of the stress, the system provides an unbiased interaction of (I) and (II), where a difference between BI and UI indicates that the stress alters the interaction of (I) and (II). (I) is selected from of (I) and (II), where a difference between BI and UI indicates that the stress alters the interaction of (I) and (II). (I) is selected from the stress that alters functional interaction of LDL receptor binding polypeptide with LDL receptor interaction domain. The method is useful for detecting and modulating signal transduction through LDL receptors. ABBO4778 to ABBO4909 represent LDL receptor binding proteins which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                              1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                    Detecting stress that alters interaction of LDL receptor binding polypeptide with LDL receptor interaction domain, comprises detecting difference in stress-biased and unbiased interaction of peptide and domain in a system.
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to B7-H1.2 or Butryophilin 2/3 polypeptides of human B7 polypeptide family and polynucleotides encoding such proteins. Sequences of the invention are useful for treating an immunological conditions (e.g., transplant rejection, graft-versus-host disease, allergy, asthma, inflammatory bowel disease, sepsis), diseases that are caused or exacerbated by T-cell mediated inflammation (e.g., Alzheimer's disease or atherosclerosis), autoimmune diseases (e.g., systemic lupus erythematosus, autoimmune dabetes, diabetic neuropathy, theumatoid authities sclerosis, autoimmune diabetes, diabetic neuropathy, theumatoid arthritis), bacterial or viral infections ench as human immunodeficiency virus (HIV) infection, delayed reconstitution of T-cells, defects in T-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New B7-H1.2 or Butryophilin 2/3 polypeptide of the human B7 polypeptide family, useful for treating an immunological condition e.g. transplant
encoding a polypeptide which is believed to be cytostatic, antifalmatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present svailable on WIPOWEB and is not in the specification.

                                                                                                                                                                                                                                                                                                                                                                 RESULT 15
                                                                                                                                                                                                                                                                                                                                                                                        AAU91293
```

the invention relates to an isolated of your and to be controlled are a controlled to a secreted polypeptide, of the mature form of NOVI, 2a, 2b, 3b, 3b, 5c, 5d, 5d, 5f, 5g, 5h, 5i, 6, 7 and 8), a variant of NOVX, a controlled are a coll comprising the vector. an anti-NOVX anticlody, determining the presence of NOVX in a sample using the anticlody, determining the presence of NOVX oblymuclecide in a sample using a probe which binds to NOVX polymuclecide. In a sample using a probe which binds to NOVX polymuclecide, identifying a an agent which binds to C determining the presence of NOVX bolymuclecide in a sample using a probe which binds to NOVX bolymuclecide. In a sample using a probe which binds to NOVX polymuclecide, identifying a an agent which binds to NOVX including modulators of NOVX. NOVX, the polymuclecide and the cardiomyopathy, atherosclerosis, associated disorder selected from cardiomyopathy, atherosclerosis, casecolated associated associated associated selected from cardiomyopathy, atherosclerosis, casecolated associated and neuropsychiatric disorders, hypertension, wound craning associated and the antibody are useful in screening assays, detection assays (e.g., chromosomal mapping, issue typing, forensic bology), coperated pharmacogenomic), and in methods of treatment (e.g., therapeutic and prophylactic). NOVX is useful as treatment (e.g., chromosomal mapping, tasue typing, forensic bology), copredictive medicine (e.g., diagnostic assays, prognostic assays, prognostic assays, continuing and pharmacogenomic), and in methods of treatment (e.g., therapeutic and prophylactic). NOVX as vaccines to recent for potential agonist and antagonist compounds, and as batt of the acting non-human t The invention relates to an isolated cytoplasmic, nuclear, membrane bound

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 367,

Sequence 3, Application US/09354147C

Patent No. 6573067

GENERAL INFORMATION:

APPLICANT: Dib-Haj; Sulayman

APPLICANT: Waxman, Stephen G.

TITLE OF INVENTION: Modulation of Sodium Channels in Dorsal Root Ganglia

FILE REFERENCE: 44574-5004-01-US

CURRENT FILING DATE: 1999-07-16

PRIOR PLING DATE: 1998-01-29

PRIOR FILING DATE: 1998-01-29

PRIOR FILING DATE: 1998-01-29
